I have a 2D plane that contains an unknown number of 4x4 cubes. Each cube must have 4 of its vertices on the plane (this is a part of a 2D game). Is there an efficient (minimal memory usage, probably a few instructions) algorithm to set the vertices of each 4x4 cube on the plane (via indices) in the order that they should appear on the plane? A: This question is a bit vague. But if you mean (as I am interpreting the question) that you have access to the vertices, and you have the plane containing the vertices you want to make the cubes, and you are concerned only with how to arrange the vertices to place the cubes and how to use a minimal amount of memory and computations: One way to do it is to keep the vertices in a random order and shuffle them whenever you need to. This is faster than sorting them because it does not involve much processing, but it requires much more memory. Another way would be to sort them into two groups, and put the vertices into an array of triangles. You would then have to get the indices to the two groups, and calculate the new indices for the combined cube (your plane plus the cube), and then get the new indices for the combined cube again (your plane plus the cube plus the rest of the new vertices). This would be the easiest way, since you do not need to do any additional calculations when you put a vertex into the plane. Oh No "Oh No" is a song by Swedish singer Max Martin and Swedish DJ and record producer Avicii. The song was released on 1 March 2019. The song was released in advance of Avicii's debut studio album on April 14, 2019. It is an uptempo house track that builds up into a big beat and
