## HDClone 6.0.5 Enterprise Edition Portable Portable + Boot Image

... How to use There are basically four "modes" of using the program. "HDClone" is also one of several CD/DVD backup tools, which implies using "Copy" or "Copy to" in the program's context menu. "HDClone" - copies or images the entire hard disk, including the Operating system. "HDClone" - copies or images the hard disk but omits the Operating system. "HDClone" - copies or images the Operating system. HDClone's interface is very simple and user-friendly. First, press "Copy" or "Clone" to start copying or cloning the entire hard disk. This process can take a long time depending on the hard disk's size. Once the copying process is completed, the program opens the "Snapshot" tab. Press "Save" to save the hard disk as an image file and then rename and save the image file. Renaming of the image file is extremely important as it is the image file used to restore the hard disk when the hard disk is being restored. The old image file can be deleted to free up more space. "HDClone" can clone the boot sector too. For this to happen, set the device on the first screen of the program as "Boot sector" and set the destination device in "Boot sector/File system". Releases:
