Introduction The setup files can be deployed on a remote machine within a network with the aid of Emco Remote Installer or Group Policy. EMCO Remote Installer is a network application that is easy-to-use and offers centralized software management. It is designed to help you deploy software applications to remote machines on your network and keep track of deployed software across your network. If you want to deploy a setup file to remote machines within a network, EMCO Remote Installer offers you the option of deploying it using both GPO or local Active Directory. It also allows you to run various scans on the remote machines, which help you find the problem areas on the remote machine. If you are not satisfied with the results from the scans, you can easily take control of the remote machine by resetting it. What's new Emco Remote Installer Pro now comes with a new feature, Reset Programs, which allows you to remotely reset programs and their properties from a remote machine. Another new feature, Multi-Machine Deployment, lets you deploy a setup file to multiple remote machines at once. Another new feature, Remote Firmware Updates, helps you perform remote firmware updates to the remote machines. All the settings for Remote Deployment are saved within the application's profile. This makes it easy for you to quickly deploy the application to remote machines in your network using the same profile. Another feature is the ability to use an Active Directory, either GPO or local, to deploy the setup files to remote machines. It also helps you keep track of deployed applications across your network. If you are not satisfied with the results from the scans, you can easily take control of the remote machine by resetting it. If you want to scan multiple remote machines at once, you can do so using the new Multi-Machine Scan feature. Another new feature, Remote Task Scheduling, allows you to schedule the tasks for remote deployment to the remote machines.
